

BRAND GUIDELINES / MOBILE TELEMEDICINE PLATFORM

Doctium Brand System

A clinical technology identity for trusted virtual care:
precise enough for provider workflows, calm enough for
patients, and scalable enough for modern Flutter, Next.js,
and EHR-integrated software.

Version
1.0

Prepared for
Doctium App

Core colors
#133157 / #8BBBE9

Brand Story

Doctium represents healthcare that is available without friction. The identity combines a medical cross, a D-shaped care loop, and a clean technical wordmark to communicate clinical reliability, continuous access, and engineered product quality.

Trust

Deep navy anchors the brand in clinical seriousness, privacy, and secure patient data handling.

Access

The open circular mark suggests care that is reachable, connected, and always moving with the patient.

Precision

Geometric forms and disciplined spacing align the brand with high-performance software engineering.

Logo Concept

The logomark is built from two ideas: a medical cross for care and a structured D form for Doctium. The light-blue cross softens the experience for patients, while the navy D gives the platform a secure, enterprise-ready presence.

The logo should never feel decorative. In product surfaces it functions as a trust signal: calm, precise, readable, and separated from clinical alerts or patient data.

Logo Anatomy

ELEMENT	ROLE	USAGE
Logomark	Medical cross plus D-shaped care loop.	App icon, favicon, compact navigation, loading identity.
Wordmark	Uppercase technical logotype.	Primary brand recognition in marketing and large UI surfaces.
Tagline	"Your doctor, anytime, anywhere."	Use only when the signature is large enough for legible rendering.

Logo Variations

Light Background Version

Use on white, clinical canvas, app onboarding, app store graphics, and patient-facing communications.

Dark Background Version

Use on secure dashboard shells, dark-mode launch screens, presentation covers, and video surfaces.

Usage Rules

Approved

- Use the full signature for brand introductions and marketing pages.
- Use the isolated mark for app icons, favicons, launchers, and tight UI spaces.
- Keep the navy and sky-blue pairing intact for official brand use.
- Place the logo on clean, high-contrast backgrounds.
- Keep the tagline only when it remains clearly legible.

Not Allowed

- Do not stretch, skew, rotate, crop, or redraw the symbol.
- Do not recolor the logo with warning, error, or success colors.
- Do not add shadows, bevels, glows, gradients, or glass effects.
- Do not place the logo over patient imagery or busy EHR data surfaces.
- Do not recreate the wordmark with a standard typed font.

Clear Space and Minimum Size

Define X as the width of the vertical stem in the light-blue medical cross. Maintain at least 1X of clear space around the full logo and 0.75X around the isolated app mark. In dense clinical dashboards, no alerts, patient identifiers, filters, or appointment chips should enter this space.

ASSET	DIGITAL MINIMUM	PRINT MINIMUM	RULE
Full signature with tagline	240 px wide	55 mm wide	Use for marketing and onboarding only.
Full signature without tagline	160 px wide	32 mm wide	Use where the tagline would become too small.
Isolated logomark Doctium Brand Guidelines	24 px wide	8 mm wide	Use for compact interface identity.

Color Palette

The palette is designed for high-reliability healthcare software: stable brand colors, restrained neutrals, and status colors that are reserved for patient-care and system feedback.

Primary, Secondary, and Accent Colors

 Doctium Clinical Navy #133157	 Precision Sky Blue #8BBBE9	 Connected Care Teal #2CB7A7
 Interface Blue #2563EB	 System Info Cyan #38BDF8	 Deep EHR Surface #0B1726

Neutrals

 Primary Text #111827	 Secondary Text #4B5563	 Divider Gray #E5E7EB
 Clinical Canvas #F7FAFC	 White #FFFFFF	

Status Colors

 Success #12B76A	 Warning #F79009	 Error / Alert #D92D20
--	---	--

Status colors are never logo colors. In a health platform, green, amber, and red must remain reserved for workflow meaning: completed, pending, failed, urgent, or destructive.

Typography

Doctium typography should be legible before it is expressive. The system uses clean sans-serif families that work across mobile, web dashboards, clinical forms, and marketing surfaces.

ROLE	TYPEFACE	USE
Primary	Plus Jakarta Sans	Marketing headings, onboarding titles, brand moments.
Secondary	Inter	Body text, clinical UI, forms, tables, labels, developer documentation.
System fallback	SF Pro / Segoe UI / Roboto	Native mobile and platform-specific rendering.

Mobile Type Scale

TOKEN	SIZE	LINE HEIGHT	WEIGHT	USE
display-md	32 px	40 px	700	Onboarding and major patient-facing titles.
heading-lg	24 px	32 px	700	Screen title and visit summary title.
heading-md	20 px	28 px	700	Appointment detail sections.
heading-sm	18 px	26 px	600	Card and modal titles.
body-lg	16 px	24 px	400	Primary reading text.
body-md	14 px	20 px	400	Standard UI body and helper copy.
label-md	13 px	18 px	600	Form, filter, and chart labels.
caption	12 px	16 px	500	Metadata and timestamps.

UI Voice

Product Language

Clear, calm, direct, and clinically careful. Avoid hype in patient-care flows and reserve urgency for true action states.

Marketing Language

Confident and accessible. Emphasize anytime access, trusted clinicians, secure records, and continuity of care.

Digital Asset Package

The following files are available in the brand guidelines directory and should be treated as the current production handoff set for web, mobile, favicon, and documentation use.

	doctium_app_logo_lightbg.png Full logo on white background for light-mode use, app onboarding, and marketing documents.
	doctium_app_logo_darkbg.png Full reversed logo on deep EHR surface for dark-mode screens and presentation covers.
	Doctium App Logo.png Source logomark reference for compact identity, launcher concepts, and favicon derivation.
	doctium_logo_main.svg Outlined SVG brand signature with separate navy and sky-blue paths for scalable product use.
	doctium_app_favicon.ico Multi-resolution favicon package containing 16x16, 32x32, and 48x48 icon entries.

Implementation Notes

PLATFORM	GUIDANCE
Next.js	Use SVG for sharp UI rendering. Use the ICO for browser favicon compatibility and PNG assets for Open Graph or app manifest images.
Flutter	Use PNGs for launcher and splash pipelines. Use SVG only where the rendering package is already part of the application stack.
App stores	Use isolated logomark exports for app icons. Do not place the full wordmark or tagline inside launcher icons.
EHR dashboards	Use compact logo placement in navigation chrome. Keep the logo away from urgent alerts, vitals, and patient identifiers.

Final Brand Principles

Reliable

Every visual choice should support trust in care delivery, identity, and patient data handling.

Efficient

Interfaces should feel fast, readable, and task-focused for both patients and providers.

Human

Clinical precision should be balanced with warm, accessible language and patient-friendly hierarchy.

Product Expression

Patient Experience

Patient-facing screens should reduce anxiety: simple actions, clear appointment status, visible provider context, and calm confirmation states. Use sky blue and teal as supportive cues, not decorative noise.

Provider Experience

Provider-facing workflows should feel dense but ordered. Use navy for structure, neutrals for data-heavy content, and status colors only where they clarify clinical or operational priority.

Release Checklist

CHECK	APPROVAL STANDARD
Logo contrast	The logo remains readable on light and dark backgrounds without added effects.
Color discipline	Success, warning, and error colors are used only for status meaning, never brand decoration.
Asset fit	Launcher, favicon, and app store icons use the isolated mark, not the full wordmark.
Clinical clarity	Brand elements never compete with vitals, appointment urgency, prescriptions, or patient identifiers.
